

Supersymmetry Parameter Analysis with Fittino

Philip Bechtle (SLAC)

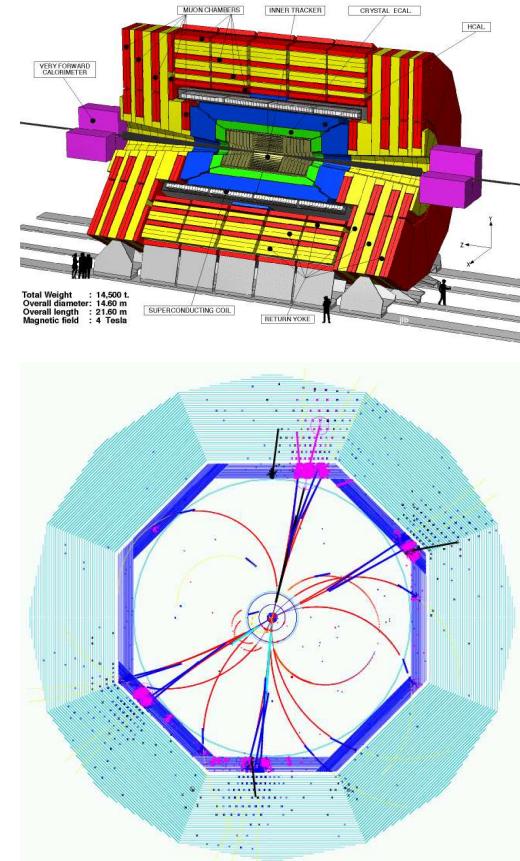

Klaus Desch (Univ. Freiburg)

Peter Wienemann (DESY)

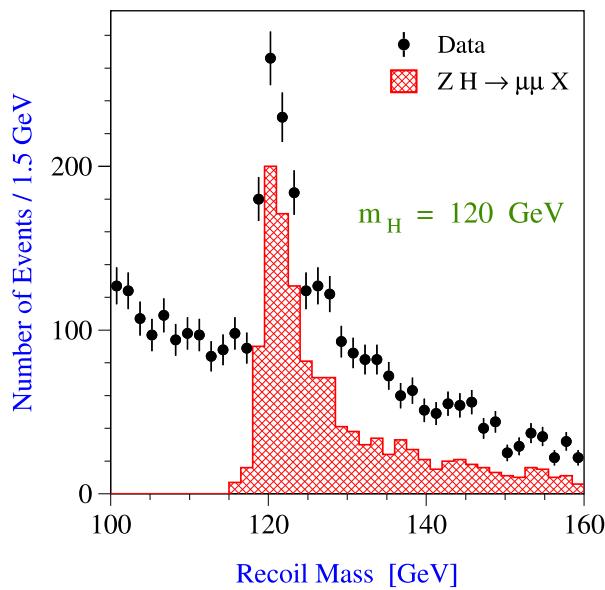

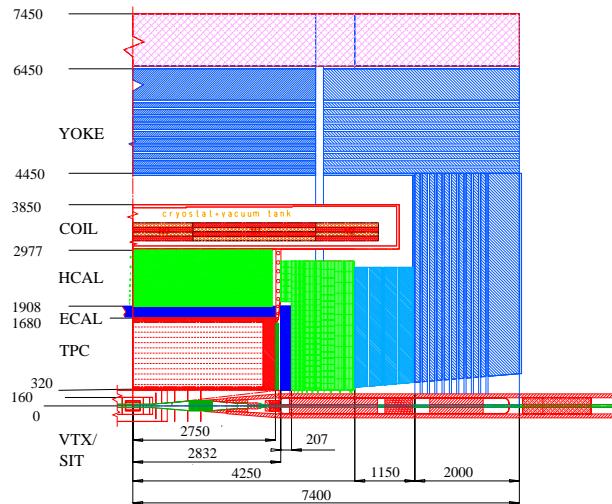

LCWS 05, Stanford, 19.03.2005

Outline

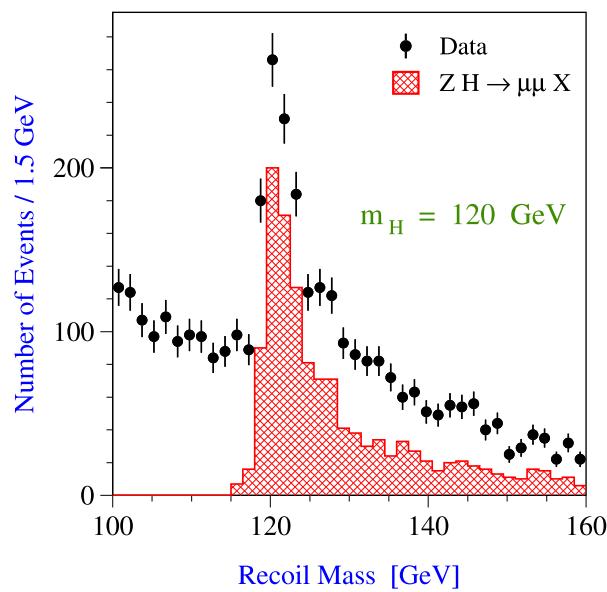

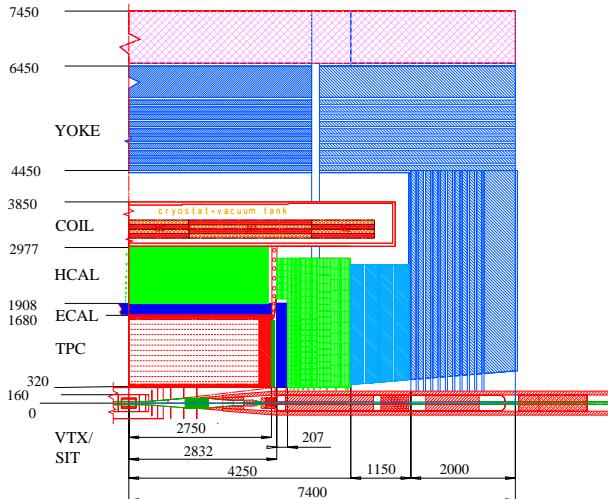

- Motivation and introduction to Fittino
- Parameter determination in Fittino
- Fittino results using ILC and LHC observables
- One more very convincing reason why life without the ILC is very boring
- Conclusions

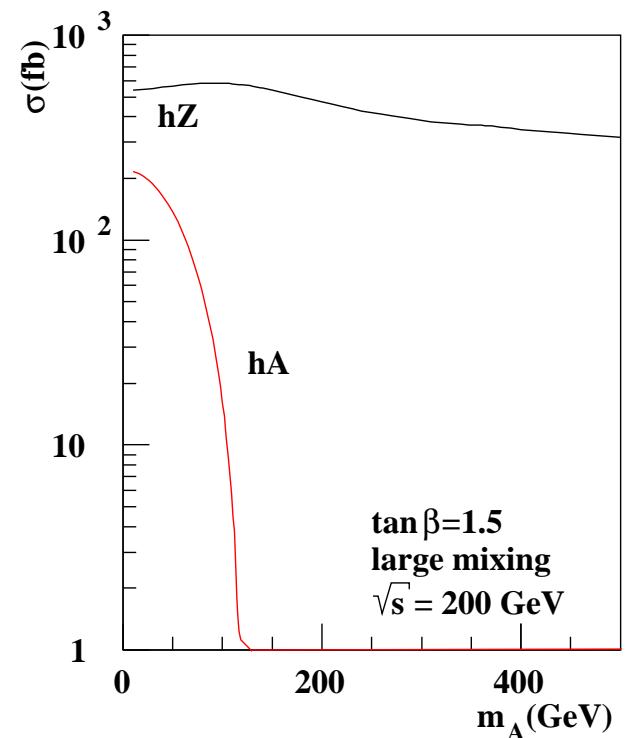

Linking Measurements and Theory

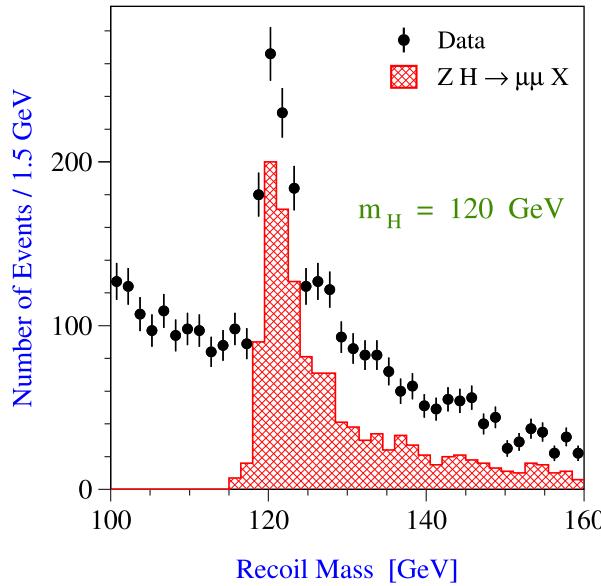

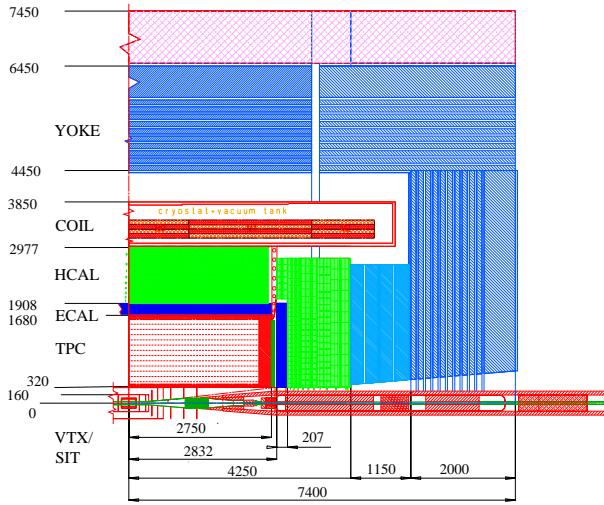

Linking Measurements and Theory

$$\begin{aligned}
 V_{\text{Higgs}} = & m_{1H}^2 |H_1|^2 + m_{2H}^2 |H_2|^2 \\
 & - m_{12}^2 (\epsilon_{ij} H_1^i H_2^j + h.c.) \\
 & + \frac{1}{8} (g^2 + g'^2) (|H_1|^2 - \\
 & |H_2|^2)^2 + \frac{1}{2} g^2 |H_1^* H_2|^2
 \end{aligned}$$

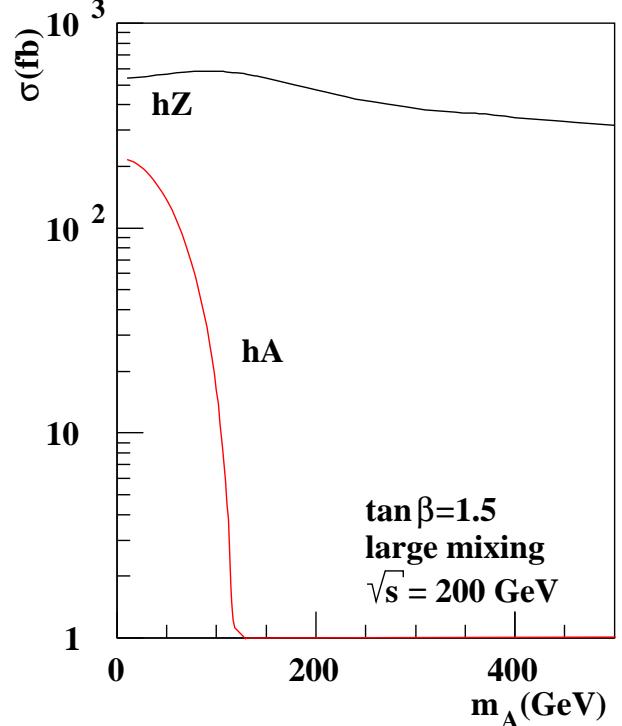

Linking Measurements and Theory

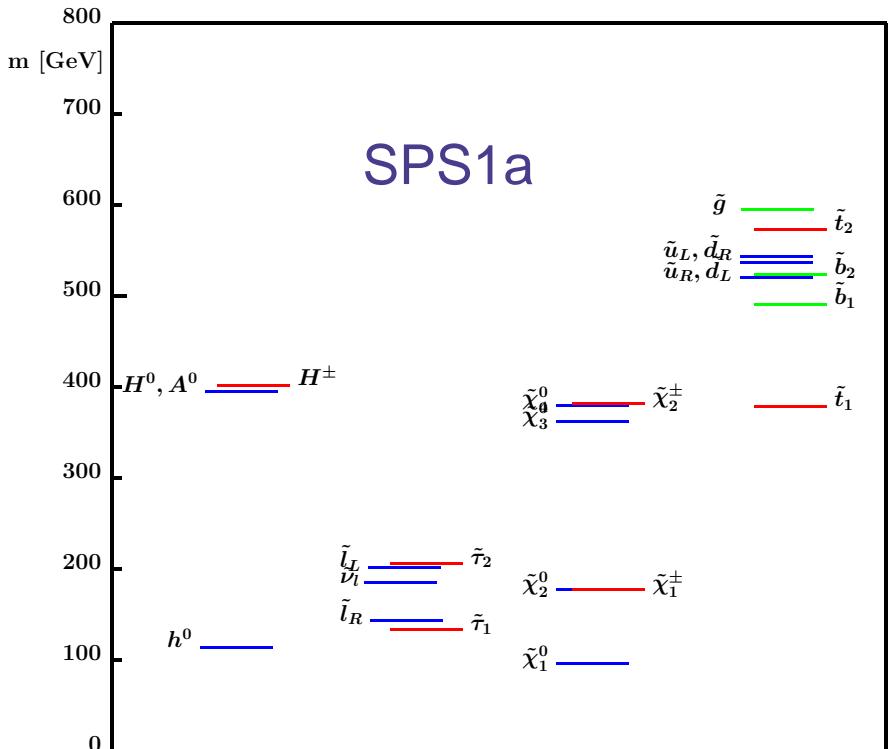

Link:
Parameter
Determination

$$\begin{aligned}
 V_{\text{Higgs}} = & m_{1H}^2 |H_1|^2 + m_{2H}^2 |H_2|^2 \\
 & - m_{12}^2 (\epsilon_{ij} H_1^i H_2^j + h.c.) \\
 & + \frac{1}{8} (g^2 + g'^2) (|H_1|^2 - \\
 & |H_2|^2)^2 + \frac{1}{2} g^2 |H_1^* H_2|^2
 \end{aligned}$$

MSSM Physics at the ILC

- Higgs physics:
 - light Higgs mass precision
 $\approx 50 \text{ MeV}$
 - light Higgs BR $\approx 2\%$
 - Discovery of heavy Higgs bosons $> 400 \text{ GeV}$
- Sleptons: $\Delta m_{\tilde{\mu}_R} = 0.2 \text{ GeV}$
- Gauginos: $\Delta m_{\chi_1^\pm} = 0.5 \text{ GeV}$
- Squarks: $\Delta m_{\tilde{t}_1} = 2 \text{ GeV}$
 - + precise analysis of quantum numbers (Higgs parity...)
 - + precise analysis of couplings from BR and σ
- indirect prediction of particle masses (LHC/ILC interplay)
- Precision of interpretation has to match precision of measurement

The Fit Program Fittino

- Determine the low-energy MSSM Lagrangian parameters from the observables from the ILC and LHC in a **global fit**
- Use **full theoretical precision, all available loop effects**
- Bottom-up approach, no assumption on SUSY breaking mechanism
- To be unbiased: Use **no prior knowledge** of the parameters at any step
- Provide easy user interface for measurements, parameter definitions and output
- **Goals:**
 - Unambiguous parameter determination without human bias?
 - Determine precision of parameter measurements
 - Test the necessary **experimental** and **theoretical** precision
- More information in <http://www-flc.desy.de/fittino/>
- Similar Program: SFitter by R. Lafaye, T. Plehn and D. Zerwas

Observables known to Fittino

- Fittino can fit to any combination of the following observables:
 - Masses of SM and MSSM particles
 - Edges in mass spectra
 - Particle widths
 - Branching fractions, sums of branching fractions
 - Cross-sections (here: only ILC)
 - Any product of cross-sections and branching fractions
 - Ratios of branching fractions
- Correlations among observables can be specified
- Limits on masses of unobserved particles can be specified

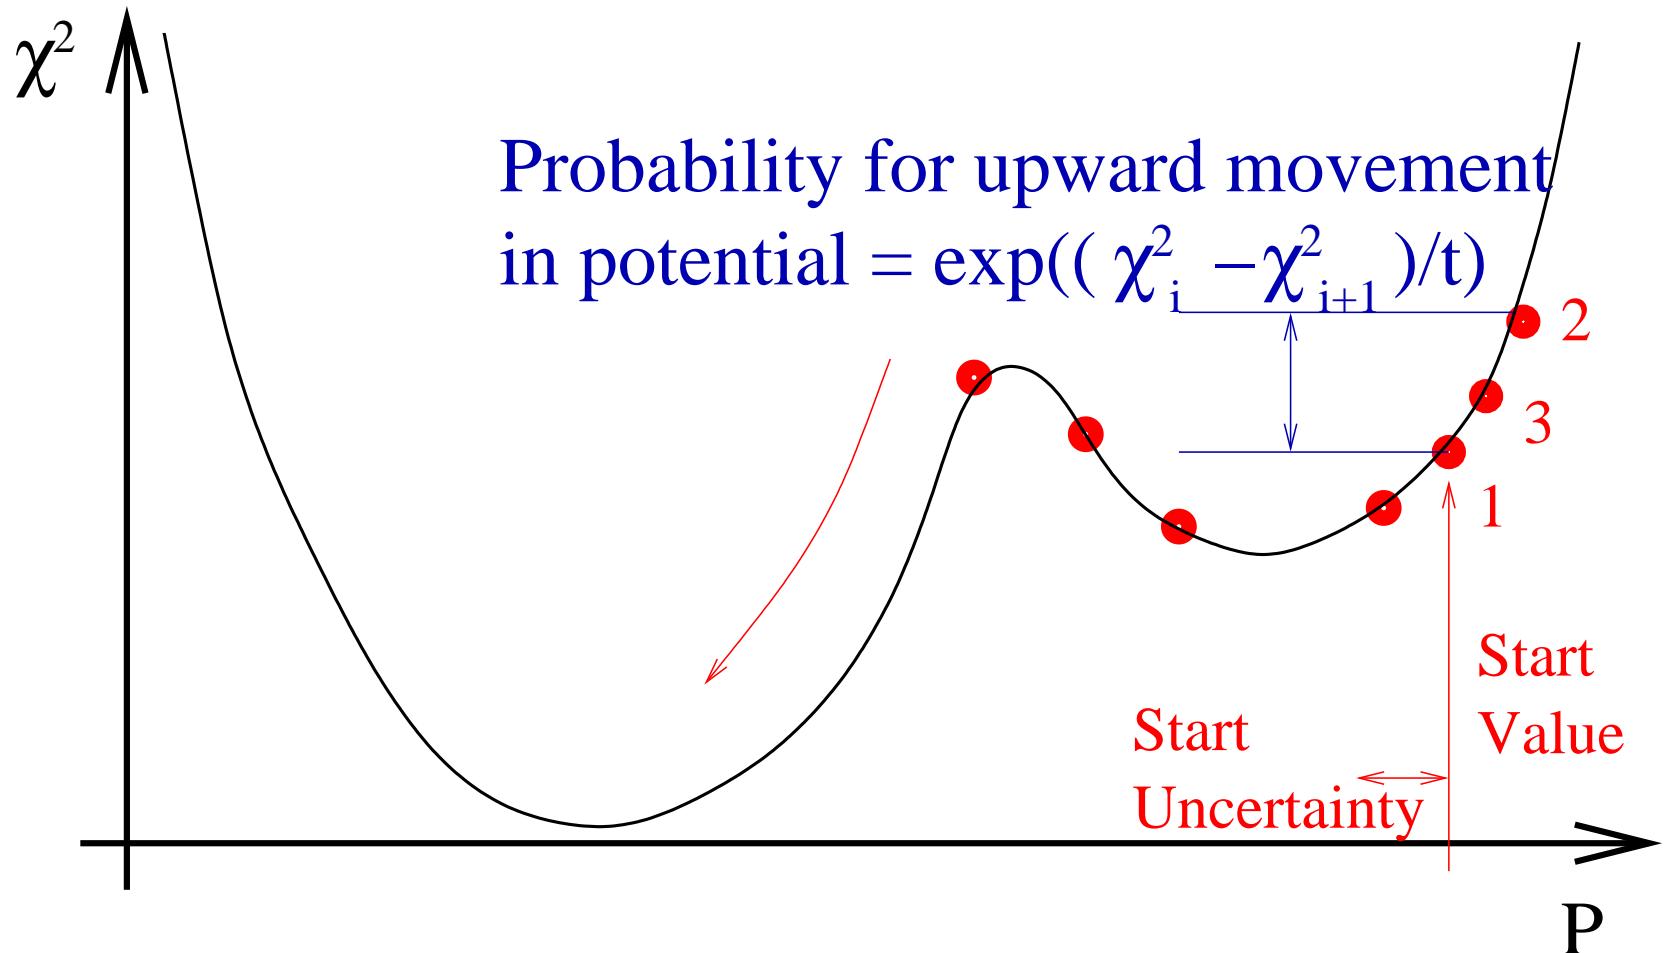

• The Iterative Fit Procedure

- Challenge: A χ^2 fit with ≈ 20 parameters probably does not converge without good start values
- Solution: Iterative fit procedure
 - Tree-level estimates of parameters P_i from observables O_j
 - Subsector fits or simulated annealing to approach/find minimal χ^2
 - Global fit to refine minimum and find global parameter uncertainties and correlations
- Additional Features of Fittino:
 - Pulls: Determine χ^2 and pull distributions from toy experiments independent check of uncertainties, biases and correlations
 - Determination of most important observables for each parameter determination
 - 2d scans and uncertainty contours

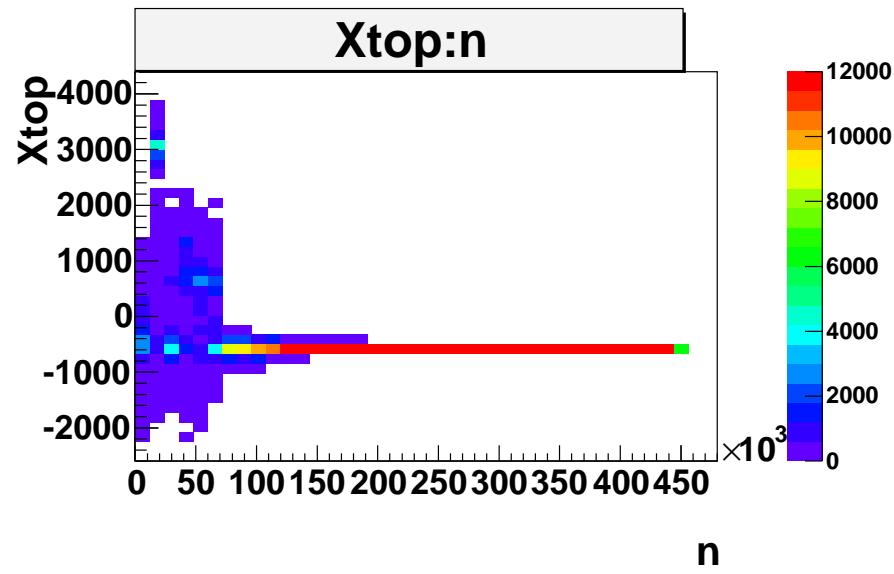

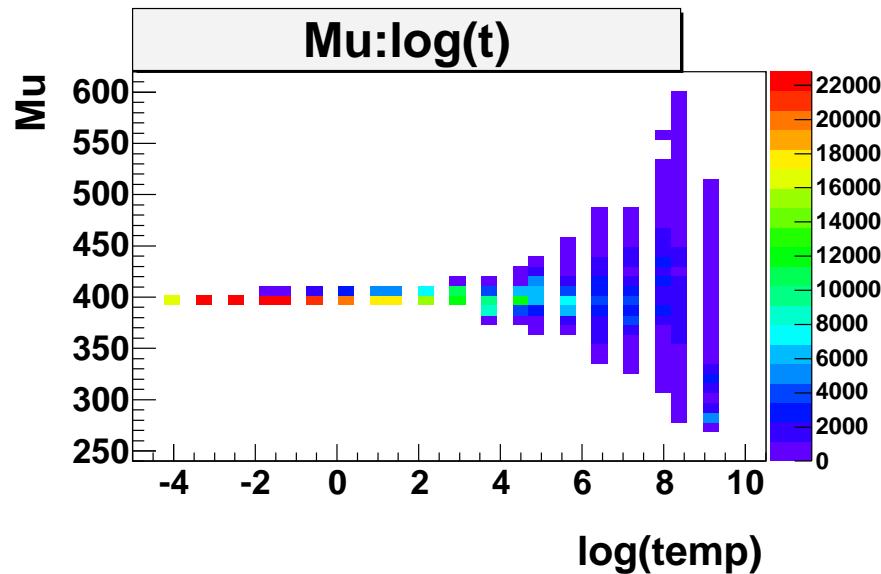

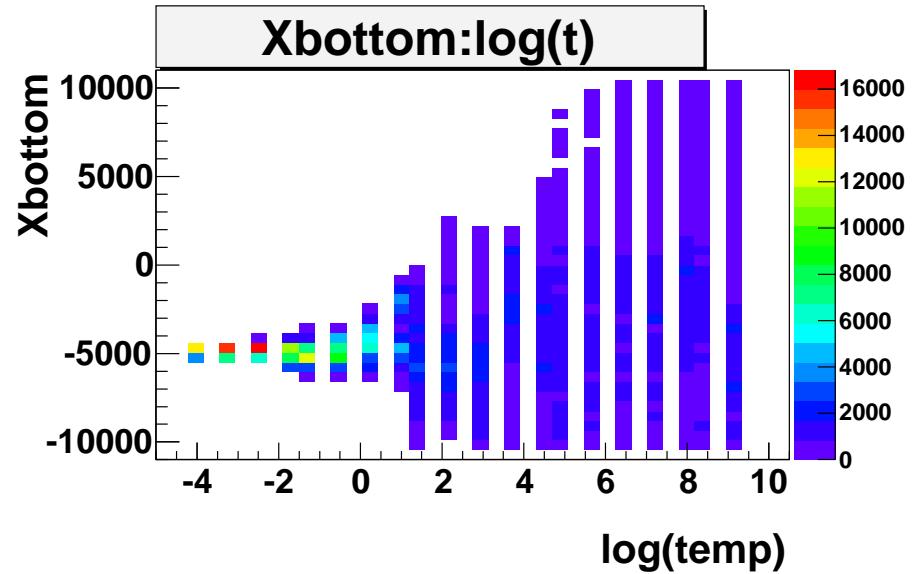

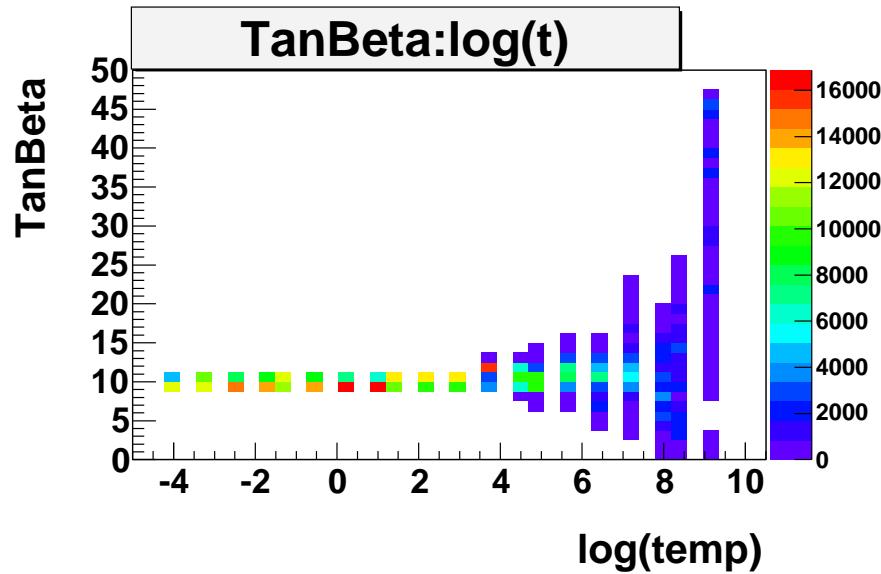

• Don't Ever Believe Minuit!

- Typically in complex fits it does not converge to the true minimum
- Even if you can check that it does: What about the uncertainties and parameter correlations?
- Clearly don't believe Minuit, if Error matrix accurate is **not** claimed
- If **Error matrix accurate**: Check error matrix!
 - Clearly something is suspicious, if one line and row is 0 apart from diagonal element
 - Even if this is not the case it might be wrong
- Always create pull distributions

Simulated Annealing

Variable parameter scan

The SPS1a' Fit: Inputs

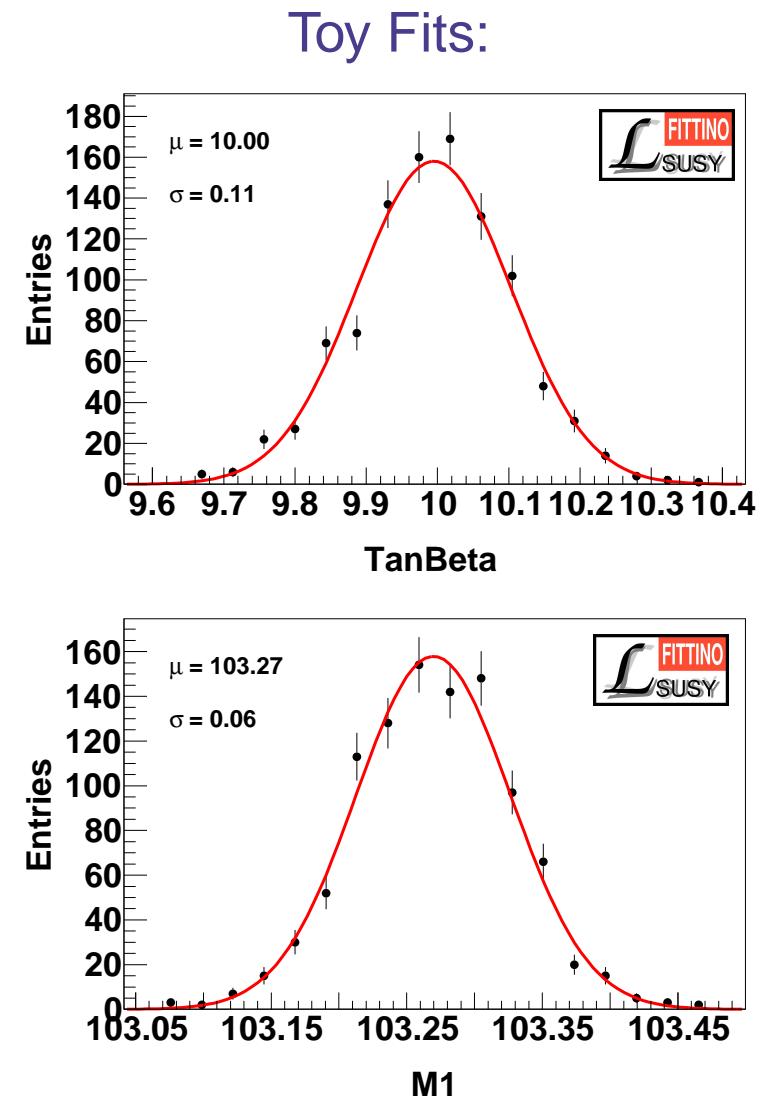

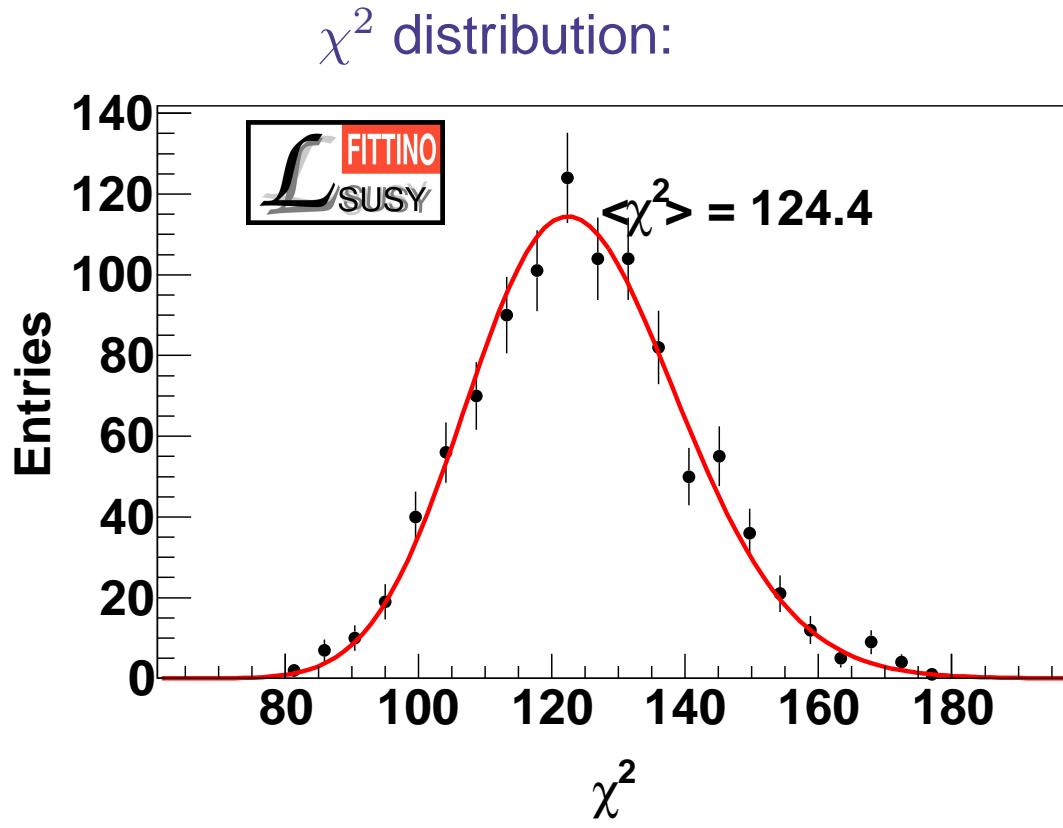

- Observables: for the SPS1a' scenario:
 - SM observables $m_Z, m_W, G_F, m_t, \dots$
 - Higgs sector masses from 500 GeV and 1 TeV ILC
 - All accessible sparticle and gaugino masses from LHC and ILC with realistic uncertainties ([hep-ph/0410364](#))
 - ILC $\sigma \times \text{BR}$ at 400,500,1000 GeV, polarisation LR, RL, LL and RR
 - absolute h BR's and σ ([hep-ph/0106315](#))
- Assumptions for this test:
 - Unification in the first two generations, no complex phases, no squark mixing across flavours
- Two fits:
 - No theory uncertainty
 - Theory uncertainty on all masses and $2\times$ larger σ uncertainties
- Use **SPheno** (by W. Porod) as SUSY calculator

Comparison of LHC and ILC+LHC

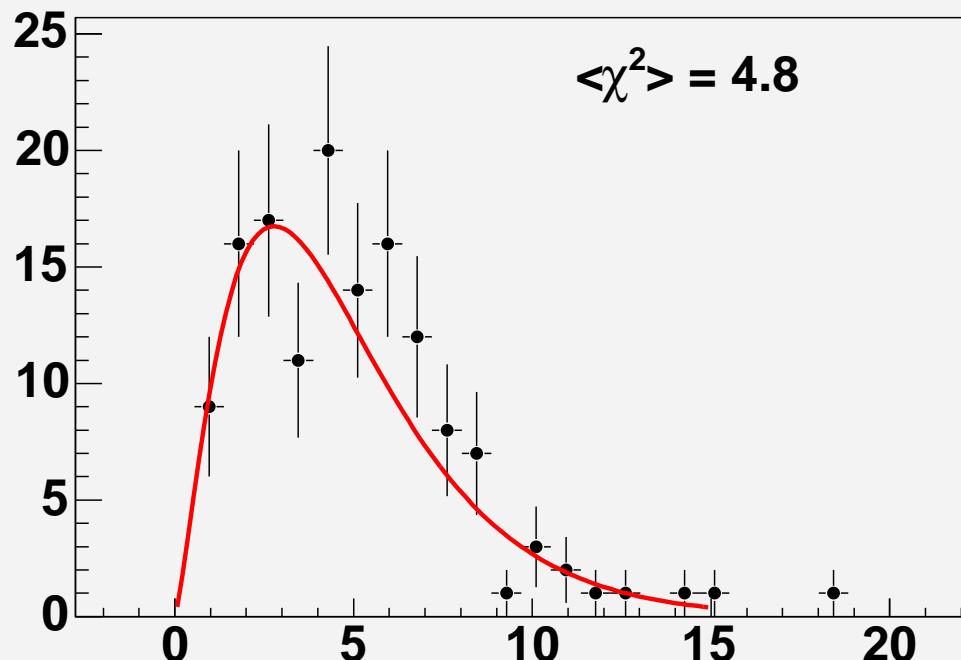

For SPS1a':

Compare the ability of LHC only and ILC+LHC to understand what is discovered:

- Use ILC+LHC inputs and results as before
- For the LHC (considered as LHC friendly assumptions):
 - SM observables as before
 - Mass measurements and precision as in LHC/ILC report
[hep-ph/0410364](#)
 - + χ_1^+ mass measurement and precision from G. Polesello *et al*/
[hep-ph/0312318](#)
 - Ratios of Higgs branching fractions from M. Dührssen [ATLAS Note](#)
- Then plot relative size of uncertainties (RMS of toy fits) and bias
(LHC only uncertainties normalized to 1, biases and ILC+LHC uncertainties normalized accordingly)

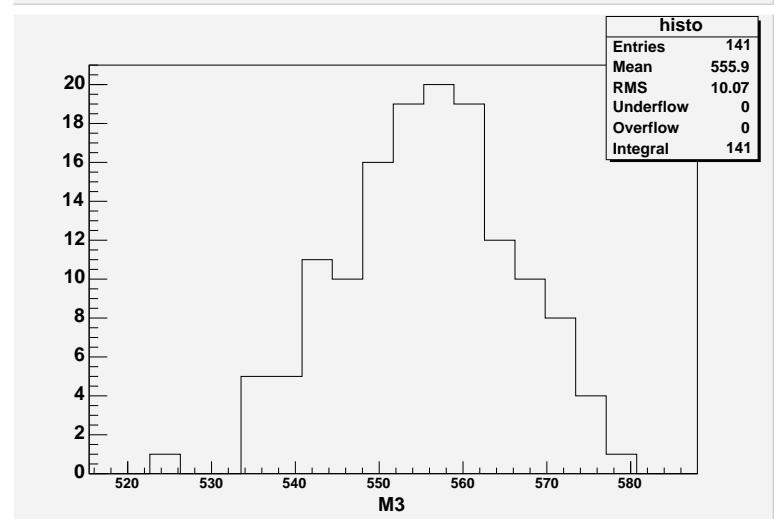

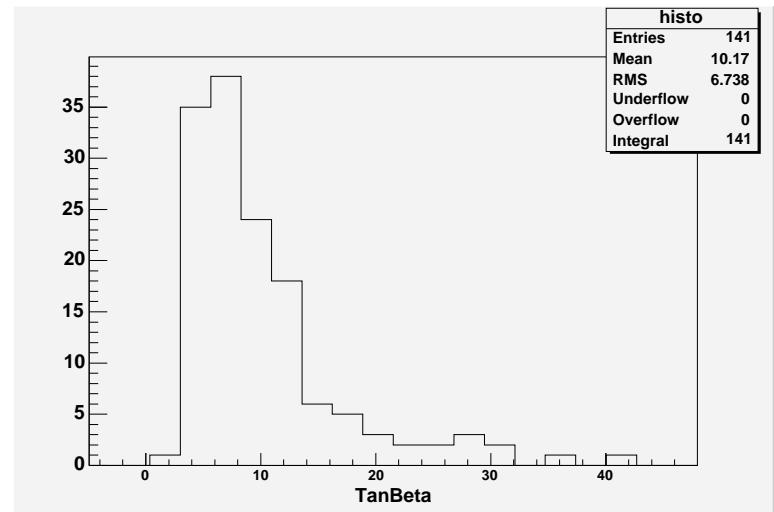

LHC only Pull Distributions

χ^2 distribution:

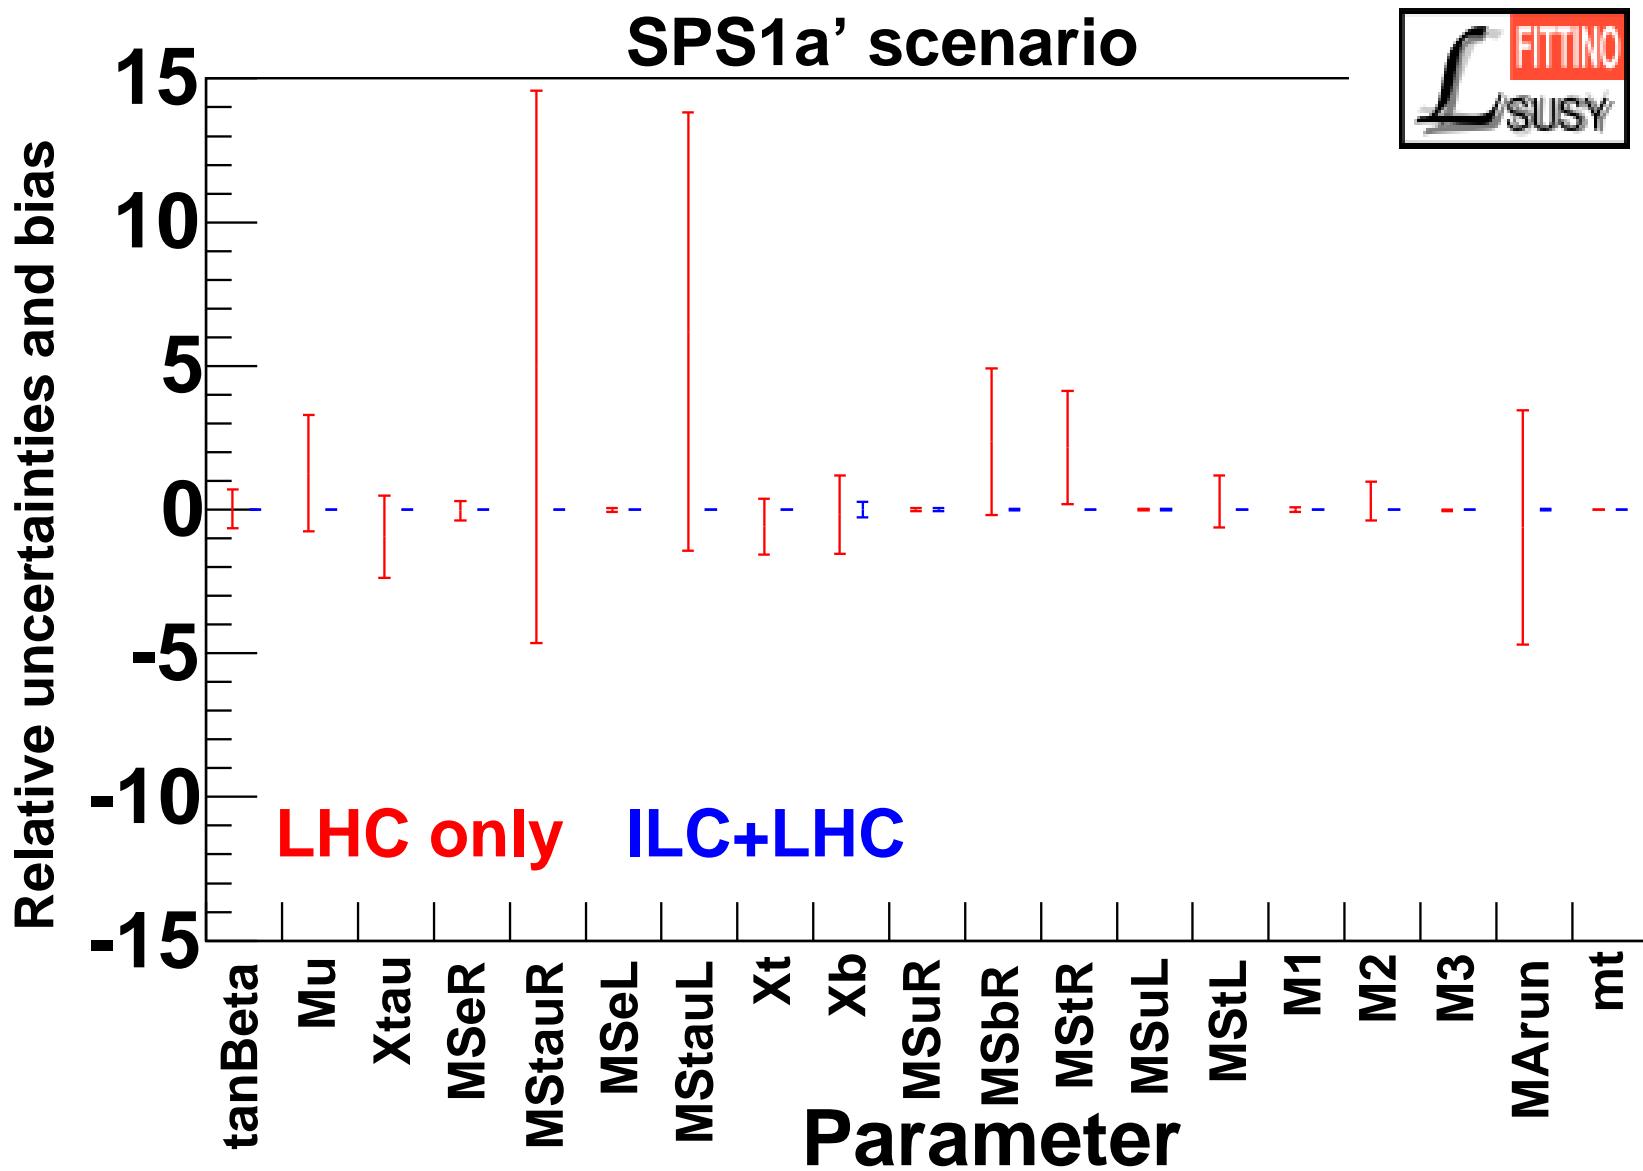

for n.d.f. = 2

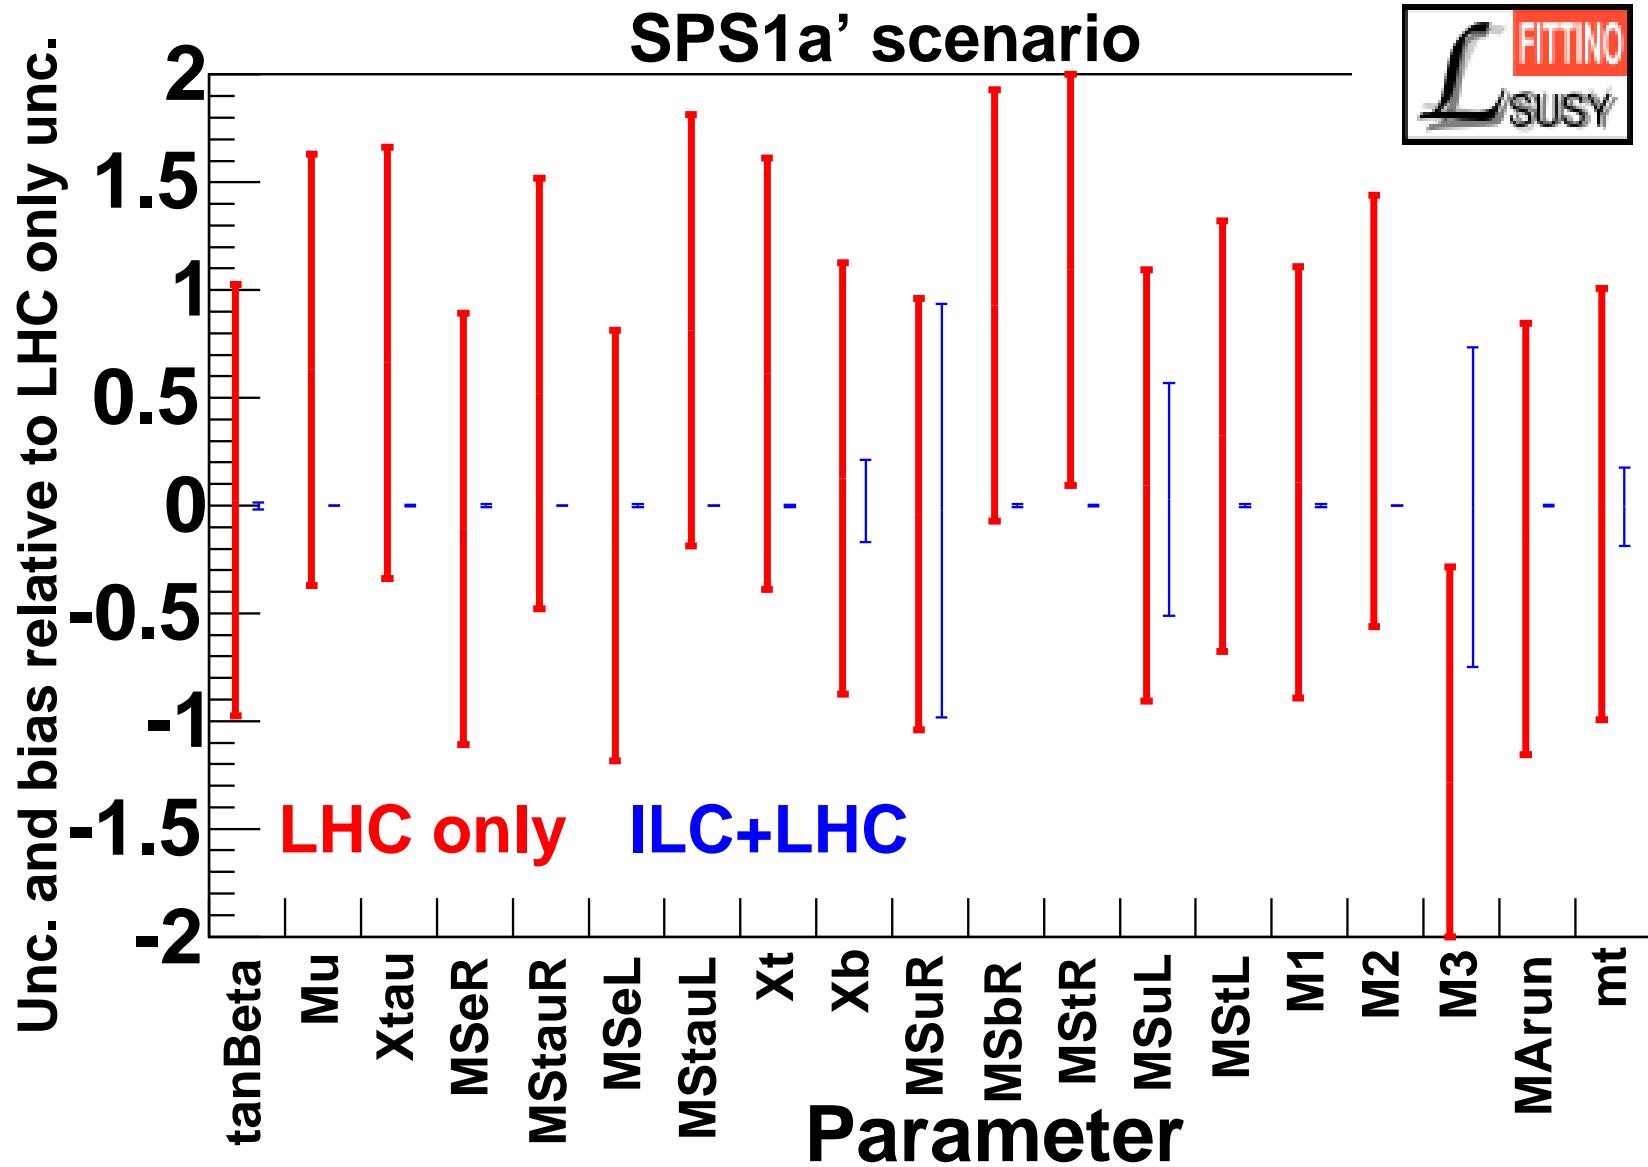

Pulls:

Comparison of LHC and ILC+LHC

Comparison of LHC and ILC+LHC

Conclusions

- Fittino measures SUSY Lagrangian parameters using many LHC and ILC observables, taking loop-corrections into account
- Fittino uses tree-level estimates, subspace fits and Simulated Annealing, allows to find the correct parameters in highly complex parameter space
- Lessons from Fittino:
 - Parameter determination is possible (non-trivial!)
 - Precise analysis of SUSY parameters requires high ILC precision
 - Theoretical Uncertainties can strongly affect parameter uncertainties
 - Fittino can be used to identify regions with need of theoretical or experimental improvements
 - Fittino could be used to optimize $\mathcal{L}(\sqrt{s}, \text{pol.})$
- Fittino is available from <http://www-flc.desy.de/fittino>, see also [hep-ph/0412012](#)
- ILC + LHC can be the era of deeper understanding of new physics

Tree-Level Estimates: Gaugino Sector

from Zerwas *et al*,
[hep-ph/0211076](https://arxiv.org/abs/hep-ph/0211076)

- Measure chargino and Neutralino masses
- Use the chargino cross-sections at different beam polarisations to determine the *pseudo-observables* $\cos 2\phi_L$, $\cos 2\phi_R$ (Chargino mixing angles)

$$|\mu| = m_W (\Sigma + \Delta(\cos 2\phi_L + \cos 2\phi_R))^{\frac{1}{2}}$$

$$\tan\beta = \left(\frac{1 + \Delta(\cos 2\phi_R - \cos 2\phi_L)}{1 - \Delta(\cos 2\phi_R - \cos 2\phi_L)} \right)^{\frac{1}{2}}$$

$$M_2 = m_W (\Sigma - \Delta(\cos 2\phi_L + \cos 2\phi_R))^{\frac{1}{2}}$$

$$M_3 = m_{\tilde{g}}$$

$$\Sigma = (m_{\chi_2^\pm}^2 + m_{\chi_1^\pm}^2)/2m_W^2 - 1$$

$$\Delta = (m_{\chi_2^\pm}^2 - m_{\chi_1^\pm}^2)/4m_W^2$$

- Get M_1 from neutralino system

The Slepton and Squark Sector

- Problem: hard to get 3rd gen. squark mixing on tree-level
- Estimate squark and slepton mass parameters with assumption $A = 0$:

$$\begin{aligned} M_{\tilde{t}_L} &= -m_Z^2 \cos 2\beta \left(\frac{1}{2} - \frac{2}{3} \sin^2 \theta_W \right) - m_t^2 + \frac{1}{2} (m_{\tilde{t}_1}^2 + m_{\tilde{t}_2}^2) \\ &= m_Z^2 \cos 2\beta \left(\frac{1}{2} - \frac{1}{3} \sin^2 \theta_W \right) - m_b^2 + \frac{1}{2} (m_{\tilde{b}_1}^2 + m_{\tilde{b}_2}^2) \\ M_{\tilde{t}_R} &= -m_Z^2 \cos 2\beta \frac{2}{3} \sin^2 \theta_W - m_t^2 + \frac{1}{2} (m_{\tilde{t}_1}^2 + m_{\tilde{t}_2}^2) \\ M_{\tilde{b}_R} &= m_Z^2 \cos 2\beta \frac{1}{3} \sin^2 \theta_W - m_b^2 + \frac{1}{2} (m_{\tilde{b}_1}^2 + m_{\tilde{b}_2}^2) \\ X_t &= -\mu / \tan \beta \\ X_b &= -\mu \tan \beta \end{aligned}$$

- Slepton sector treated analogously
