

Time Projection Chamber (TPC)
Main detector in ALICE

The Grid: a Powerful Tool for Physics

Visualisation of a
simulated Pb-Pb collision

High Energy Physics in the 21st century has increasing requirements:
- Enormous amounts of data accessed for collaborators all over the world
- Very large computer power to treat the data

Solution developed thanks to improving data transfer:

The Grid

Send data and jobs to clusters of computer all over the world, transparently for the user
Different strategies are used
Here are 2 examples

ARC: Advanced Resource Connector
- Initiated by the Nordic countries, used in many more
- Highly distributed
- Used also for biology, chemistry...

Reconstruct Events

ALICE: A Large Ion Collider Experiment
Colliding lead ions in LHC to explore the Quark-Gluon Plasma

Simulate Events

AliEn: ALICE Environment
Solution developed by ALICE
- centralised
- "job wrappers" on the nodes pull "real jobs" and run them
- packages auto-installed

Analyse Data

Interoperation

Getting projects to work together.
The Nordic community wants to appear as a single large site to the LHC Grid
The job distribution within the Nordic countries should only be done with the local software ARC

Send Jobs with ARC

- Install packages
- start job wrapper
